

A Gaussian shell of amplitude ϵ multiplies the conformal factor at $t=0$. Since $R \propto \psi^2$ the arms start 2ϵ apart: that offset is the kick.

Each throat first moves the way it was pushed, returns, and crosses at $t \simeq 13.1$ (dotted). Only after the crossing does the fate declare itself, with the opposite sign.

Growth rate still settling ($\epsilon = -0.01$: 0.20, $\epsilon = +0.01$: 0.20; level 3's own seed gives 0.17), so none is quoted. Level 3, stop time 100; as of this build, -0.01 to $t=28$, +0.01 to $t=28$.
